VOL. LVI. BOSTON, MASS., ANNUAL, 1944. No. 13.

GENERAL SUMMARY.

There were several outstanding abnormalities in weather conditions in New England during the year 1944, but spreading these throughout the twelve months, and over the six States, the annual averages present no notable variations from the arithmetic means of the past 57 years. The year was normal, in spite of many occurrences of weather of record-breaking character, a seemingly paradoxical, but true statement. In January in northeastern Maine there was less snow and total precipitation, with higher average temperature than ever before in the mid-winter season. Otherwise the month's severity of weather was not unduly mitigated. February continued its contribution of less severe weather, and the winter left a feeling in the three southern States of less rigorous conditions than usual. But in northern regions accumulated deep snow was particularly harsh and confining. March and April were cold months, and the usual promises of spring in the air were disappointing. More snow fell in the second half of March than in the earlier half. The maple industry was backward, and frost did not leave the ground in northern counties until well on toward the close of the month, with some snow still remaining. In southern communities plowing and other crop preparations advanced steadily. The recession of snow cover in northern watersheds was so gradual that spring freshets did not develop hazardous conditions. Early May weather developed in the usual course, with typical indications of promise. Greater than normal warmth could not overcome the detrimental elements of late frost, drought, a few occurrences of hail, lightning damage and wind squalls. In the northern division it was the driest month since 1926, and in the southern division, the driest since 1903. In

(Continued on page 104)

The average annual temperature for the Section was 46.0°, which is 0.1° above the mean for the past 57 years. The average temperature for the northern division was 43.4°; fòr the southern division, 48.8°. The highest annual mean temperature was 52.0° at Chestnut Hill, Massachusetts and Providence, Rhode Island; the lowest was 37.0° at First Connecticut Lake, N. H. The highest temperature reported was 103° at Norwalk, Connecticut on August 11th; the lowest was −36° at Lake Frontiere, Maine on February 9th and December 19th. The annual range for New England was 139°; the greatest local annual range was 128° at Lemington, Vermont; the least local annual range was 73° at Nantucket, Massachusetts.

The average annual precipitation for the Section was 40.17 inches, which is 1.79 inches below the mean for the past 57 years. The average precipitation for the northern division was 38.22 inches; for the southern division, 42.06 inches. The average annual snowfall for the northern division was 86.7 inches; for the southern division, 39.4 inches, and for the Section, 63.9 inches, which is 0.5 inch above the mean for the past 57 years. The greatest annual precipitation was 56.63 inches at Pinkham Notch, New Hampshire; the least annual amount was 28.98 inches at Squa Pan Dam, Maine. The greatest local monthly amount was 11.82 inches at Hubbardston, Massachusetts in June; the least local monthly amount was 0.07 inch at Millinocket, Maine in January. The greatest amount in any 24 hours was 6.16 inches at Greenville, New Hampshire on June 24-25th. The average number of days with .01 inch or more of precipitation was 115, which is 7 below the mean for the past 57 years.

The prevailing direction of the wind was northwest. The average velocity was 9.3 miles per hour, which is 0.7 mile per hour below the mean. The maximum velocity recorded during the year was 82 miles per hour from the southeast on September 14th at Block Island, Rhode Island.

The sunshine averaged 58 percent of the possible amount, which is 4 percent above the mean for the past 51 years. Cloudiness was slightly below the mean; the average for the Section was 145 clear, 98 partly cloudy and 123 cloudy days.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

(Continued from page 99)

Boston it was the driest May since 1826, and terminated the driest consecutive 12 months period since 1910-1911. In June there was a substantial restoration of soil moisture except in southern Connecticut, Rhode Island and southeastern Massachusetts. In Concord, N. H., Fitchburg and Hubbardston, Mass., the June rains exceeded 10 inches. July, the mid-summer month, was slightly warmer than normal, and decidedly lacking in rainfall in the three southern States, which contributed substantially to adverse crop prospects in those areas. Also there were damaging local hail storms. August produced one of the longest terms of protracted heat on record. From the 11th through the 17th temperatures averaged some 10° to 20° higher than normal, and readings of 100° or higher occurred in each of the six States. This heat was accompanied by drought, and grass, pasturage, and "victory gardens" together with other produce suffered extensively. In September a typical tropical hurricane scourged southern New England and the Maine coast. Further reference to this storm is contained in the monthly summary for September. October conditions were typically favorable and generally pleasant, and, although slightly deficient in warmth and rain, the surpluses of these elements in September provided amply. Much of the month's rain attended the movement of a storm of tropical origin along the southern New England coast on the 20-21st, which was a dangerous menace until it was safely past. Harvests were generally completed, with goodly returns from potatoes, but serious losses in cranberries due to early season adversities. There was a slight surplus of warmth in November, which was particularly pronounced in northeast Maine. There was a hard storm along the south shore on the 22d, and another hard storm on the 30th moved from eastern Long Island north-northeastward, roughly along the New Hampshire-Maine boundary into Quebec. These storms provided ample volume of water supplies in streams and storage basins, and ground water levels were restored. A rapid transition occurred from the last of autumn into the first month of winter, and December was notably cold and snowy. On the 19th a snow storm covered the southern division, and this cover remained to the close of the year, with depths ranging from scarcely an inch along the south shore to over two feet in the northern higher elevations.

KILLING FROSTS.

NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR: (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVII. BOSTON, MASS., JANUARY 1945. No. 1.

GENERAL SUMMARY

The New Year opened with warm gales, heavy rains and barometric pressure under 29 inches. The snow cover was practically erased in extreme southern areas, and was generally considerably reduced elsewhere. Temperatures dropped immediately thereafter some twenty degrees to near normal, and except on three or four widely scattered days, were persistently subnormal. The month as a whole was one of the outstanding cold Januarys. A snowstorm on the 8th very thoroughly enveloped New England with a snow cover which lasted into February This cover was increased by some four or five other snowstorms, and the total accumulation of snow for the month was 12.2 inches deeper than normal. The persistent snow cover and low temperatures diminished stream flow to subnormal levels, and recalled the menacing conditions preceding the floods of March, 1936. Frost penetration was not deep, and the ground appeared to have capacity for substantial snow-melt, although ground water and baseflow levels were higher than usual for January. At the close of the month, the snow cover ranged from 6 inches or so along the south and southeastern coastal margins to 3 feet and more in the higher levels of the three northern States. A storm of sharp intensity developed from centers off the Virginia Capes and over the Virginia Blue Ridge in the early hours of the 16th, advanced to near Block Island and to the southward of it shortly after noon, and was at sea to the eastward of Cape Cod by early morning of the the 17th. There were violent wave disturbances from New Jersey to Cape Cod Bay, with pressure falls of .10 to .17 inch in ten to twenty minutes in southeastern New England, with gusts and extreme winds up to 70 miles an hour, and with blinding snow. The ravages of this storm were crippling in many parts of the three southern States.

TEMPERATURE

The average monthly temperature for the Section, based on 114 records, was 16.8°, which is 5.6° below the mean for the past 58 years. The average temperature for the northern division was 12.5°; for the southern division, 21.4°. The highest monthly mean was 28.4° at Nantucket, Mass.; the lowest was 3.4° at First Connecticut Lake, N. H. The highest recorded was 61° at Taunton, Mass. on the 1st, and at Haverhill, Mass. on the 2d; the lowest was −32° at Lemington, Vt. on the 11th. The greatest monthly range was 81° at Madison, Me. and Bennington, Vt.; the least was 48° at Chatham, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 3.79 inches, which is 0.38 inch above the mean for the past 58 years. The average precipitation for the northern division was 4.03 inches; for the southern division, 3.54 inches. The greatest monthly amount reported was 6.34 inches at Pinkham Notch, N. H.; the least was 1.77 inches at Bethlehem, N. H. The greatest amount in 24 hours was 3.09 inches at Pinkham Notch, N. H. on the 31 (Dec., 1944)-1st. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 58 years.

The average snowfall for the northern division, based on 90 records, was 34.0 inches; for the southern division, based on 81 records, 20.8 inches; for the Section, based on 171 records, 27.8 inches, which is 12.2 inches above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 131 records, was northwest. The average velocity, based on the records at 14 stations, was 11.1 miles per hour, which is 0.1 mile per hour above the mean.

The sunshine, based on the records at 12 stations, averaged 52 percent of the possible amount, which is 5 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 141 records, was 12 clear, 7 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

NOTE.—Date reference 31-1 means Dec. 31-Jan. 1.

VOL. LVII. BOSTON, MASS., FEBRUARY 1945. No. 2.

GENERAL SUMMARY

The feature of New England's weather during February, 1945 was the very severe snowstorm which occurred from mid-morning of the 8th to early morning of the 9th. The storm overspread nearly all portions of the Section, although with less intensity and snow over the northern third of the Section. Greatest deposits were recorded in eastern Massachusetts with some stations reporting falls in excess of 20 inches. Transportation and travel were very greatly impeded and the difficulties of snow removal and clearance were accentuated by lack of manpower and power machinery. From the 13th to 16th there was further slight snow accumulation, but with some thawing, settling and absorption the snow cover began to diminish in depth, although its high water content continued to maintain a constant threat for spring freshets. At the close of the month, the snow cover ranged from an inch or less on the southern shore to some 3 feet in various scattered elevated points in the northern division. The total monthly volume of snow was slightly greater in the southern division than in the north, an infrequent but hardly rare occurrence. Temperature variations from normal were rather unimportant, with a preponderance of days of above normal warmth, and a noticeable absence of extremes of temperature. In considering the period from December, 1944 through February, 1945, the general impression that a "very hard winter" had prevailed is somewhat corroborated by the statistics: December was a cold month; January was exceptionally severe as to both temperature and volume of snow; February's excessive snowfall, particularly in the southern division, maintained a continuous snow cover (which had lasted from early January) to the end of February. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 114 records, was 24.0°, which is 1.3° above the mean for the past 58 years. The average temperature for the northern division was 20.6°; for the southern division, 27.8°. The highest monthly mean was 32.7° at New London, Conn.; the lowest was 13.6° at Caribou and Ripogenus Dam, Me. The highest recorded was 54° at Fall River, Mass. on the 22d; the lowest was −30° at Lake Frontiere, Me. on the 18th. The greatest monthly range was 72° at Ft. Kent, Me.; the least was 33° at Point Judith, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 3.44 inches, which is 0.37 inch above the mean for the past 58 years. The average precipitation for the northern division was 2.90 inches; for the southern division, 3.99 inches. The greatest monthly amount reported was 6.16 inches at Somerset, Vt.; the least was 0.74 inch at Bethlehem, N. H. The greatest amount in 24 hours was 2.90 inches at Franklin, Mass. on the 8-9th. The average number of days with .01 inch or more of precipitation was 10, which is 1 above the mean for the past 58 years.

The average snowfall for the northern division, based on 90 records, was 20.0 inches; for the southern division, based on 82 records, 21.9 inches; for the Section, based on 172 records, 20.9 inches, which is 4.5 inches above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 135 records, was northwest. The average velocity, based on the records at 14 stations, was 10.1 miles per hour, which is 1.6 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 56 percent of the possible amount, which is 5 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 144 records, was 10 clear, 8 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 78 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut,)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for February 1945

VOL. LVII. BOSTON, MASS., MARCH 1945. No. 3.

GENERAL SUMMARY

The temperature during March, 1945 in New England was the outstanding element of weather, and was a characteristic example of what makes New England's weather famous. From the 22d of February, almost without interruption to the end of March, every day was decidedly warmer than normal, with average daily excesses of about ten degrees. There were but two or three days with temperatures down to or slightly under normal. During this period from February 22d to the end of March, temperatures rose steadily from a general average of about 22° to a general average of about 54°, or more than 30°, while the normal increase of warmth at this time of year is about 10° per month. On the 29th, temperatures rose to well up in the 80's except in extreme northern counties and localities affected by ocean air, and reached 90° at Providence, R. I., the highest March record of all time in New England. This remarkably sustained increase of warmth was the feature which broke the records of two very warm Marches of 1903 and 1921, when it was close to the same temperature, but not so unbrokenly sustained. At the beginning of the month there was a residue snow cover of from a trace or a few inches near the coast to nearly three feet in the northern interior. This was all melted or evaporated by the month's end, except for a few inches in central and northern Maine. Rainfall during the month was mostly evenly distributed as to amount and frequency of occurrence, and, fortunately, was consistently subnormal. The great heat and the rapidly melting snow presented a constant hazard of floods, and water courses were at bank full stages at the end of the month. Most of these high stages, however, were dispersed by storage and absorption, so that there were but few, not too serious overflows. The sudden advent of summer warmth produced an astounding advance of season in vegetation and social activities, with consequent ill forebodings of frosts later to kill some of the three to six weeks out of season advance.

TEMPERATURE

The average monthly temperature for the Section, based on 114 records, was 40.7°, which is 8.5° above the mean for the past 58 years. The average temperature for the northern division was 37.4°; for the southern division, 44.2°. The highest monthly mean was 48.5° at Springfield, Mass.; the lowest was 28.2° at Caribou, Me. The highest recorded was 90° at Providence, R. I. on the 29th; the lowest was −29° at Lake Frontiere, Me. on the 12th. The greatest monthly range was 81° at 5 stations in the northern division; the least was 34° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 2.05 inches, which is 1.60 inches below the mean for the past 58 years. The average precipitation for the northern division was 1.91 inches; for the southern division, 2.18 inches. The greatest monthly amount reported was 4.40 inches at Eastport, Me.; the least was 0.87 inch at Walpole, N. H. The greatest amount in 24 hours was 1.93 inches at Eastport, Me. on the 22d. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 58 years.

The average snowfall for the northern division, based on 92 records, was 5.3 inches; for the southern division, based on 78 records, 2.7 inches; for the Section, based on 170 records, 4.1 inches, which is 7.1 inches below the mean for the past 58 years.

JUN 8 1945
UNIVERSITY OF ILLINOIS

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was southwest. The average velocity, based on the records at 14 stations, was 9.5 miles per hour, which is 1.9 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 58 percent of the possible amount, which is 6 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 144 records, was 13 clear, 7 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 75 percent, which is 1 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut,)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for March 1945

VOL. LVII. BOSTON, MASS., APRIL 1945. No. 4.

GENERAL SUMMARY

There was little or no interruption of the remarkably warm, almost summer-like weather which continued from March through the first three weeks of April, throughout the greater part of New England. There were days with maximum temperatures in the 80's, and excesses of warmth of twenty degrees and more above normal. Rainfall was light and sunshine was generous. But on the 22d temperatures dropped and continued subnormal to the end of the month. However, it was the warmest April ever recorded, and taken in connection with the preceding March, which was also the warmest on record, the advance of vegetation was far beyond anything known before. The maple sugar industry was ended at the end of March while it usually extends beyond the third week of April, and production was very short. Such plants as asparagus and strawberries were far advanced, and seriously damaged by the hard frosts of the 23d-24th. Milk production was greatly aided by the early growth of grass and pasturage. The larger varieties of forest trees were about the only forms of vegetable growth which were not far in advance of the seasonal normal. Streamflow was slightly subnormal in Vermont and southern New England, but storage supplies and ground water were mostly normal, or somewhat above normal.

The last week of the month averaged almost five degrees cooler than the first, while the normal increment of warmth would usually be about ten degrees from the beginning to the end of April. The month slightly exceeded the famously warm April of 1921, in that the temperature averaged fractionally higher and that at times the vegetation season was 5 to 6 weeks in advance of normal.

TEMPERATURE

The average monthly temperature for the Section, based on 113 records, was 49.1°, which is 5.4° above the mean for the past 58 years. The average temperature for the northern division was 47.0°; for the southern division, 51.2°. The highest monthly mean was 55.2° at Springfield, Mass.; the lowest was 41.2° at First Connecticut Lake, N. H. The highest recorded was 89° at Adams, Mass. on the 11th, Orono, Me. and Falls Village, Conn. on the 12th, and at 5 stations in New Hamphire, Vermont and Massachusetts on the 13th; the lowest was 13° at Ft. Kent, Me. on the 4th, Vanceboro, Me. on the 7th and 16th, and First Connecticut Lake, N. H. on the 23d. The greatest monthly range was 72° at Franklin, N. H.; the least was 33° at Chatham, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 4.49 inches, which is 1.14 inches above the mean for the past 58 years. The average precipitation for the northern division was 4.87 inches; for the southern division, 4.13 inches. The greatest monthly amount reported was 7.91 inches at Whitingham, Vt.; the least was 1.39 inches at North Truro, Mass. The greatest amount in 24 hours was 4.06 inches at Springfield, Mass. on the 25-26th. The average number of days with .01 inch or more of precipitation was 11, which is 1 above the mean for the past 58 years.

The average snowfall for the northern division, based on 92 records, was 0.7 inch; for the southern division, based on 90 records, a trace; for the Section, based on 182 records, 0.4 inch, which is 3.7 inches below the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was northwest. The average velocity, based on the records at 14 stations, was 11.0 miles per hour, which is 0.2 mile per hour above the mean.

The sunshine, based on the records at 13 stations, averaged 57 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 139 records, was 11 clear, 7 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 72 percent, which is 5 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras.— 1st, 2d, 5-7th, 9th, 11-15th.

Halos, lunar.— 14th, 20th, 22d.

Halos, Solar.— 8th, 13-15th, 17th, 18th, 20th, 21st, 24th.

Hail. — (dates and general location) — On 1st at East Winthrop, Me.; on 4th at Bangor, Eustis, Houlton and Middledam, Me.; on 30th at Norwalk and Storrs, Conn.

Thunderstorms.—(State, dates and number of stations reporting; N-northern division, S-southern division) — 1st, N4, S2; 2d, S1; 4th, N3; 5th, S2; 13th, N17, S1; 14th, N6, S1; 17th, N7, S10: 18th, N1, S6; 21st, N7, S1; 22d, N1; 25th, S1; 26th, N1, S5; 27th, S2; 30th, S5.

Fog, dense.— 1-3d, 5th, 8-14th, 17th, 18th, 20th, 21st, 26th, 30th.

Frosts. — (latest date of killing frost in month)—Generally on 23d or 24th; in the more susceptible areas, progressively, on 25th and 27-30th; in some areas along immediate coast on 7th or 8th. None in sheltered areas along immediate coast of southern division.

Sleet. — (dates and general location) — In northern division, scattered, on 3-5th, 19th and 30th; in southern division, scattered, on 4th, 5th, 21st, 27th, 28th.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for April 1945

CLIMATOLOGICAL DATA

NEW ENGLAND SECTION

G. H. NOYES

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVII. BOSTON, MASS., MAY 1945. NO. 5.

GENERAL SUMMARY

A singular and rather steady outflow of polar air poured over New England the greater part of May, 1945, with resulting subnormal warmth and sunshine, and excess of rain and gloomy, cool weather. Along the southeastern margins of the cool air masses there were frequent developments of disturbances which moved northeastward, keeping New England well enveloped in cloudiness and in conditions which were persistently adverse to plant growth and farming and other out-of-door operations. On Thursday the 10th a disturbance developed over the lower Ohio and moved rapidly northeastward toward New England. During the early hours of the 11th snow fell over nearly all of New England from the Litchfield and Bolton Hills of Connecticut northward and northeastward, excepting Rhode Island and southeastern Massachusetts. An irregularly shaped area of 10 inches or greater snow depth extended from the Berkshires, over the southern Green Mountains, the White Mountains and over the Rangeley and Moosehead Lakes region, with maximum depths of over two feet in the Mount Washington region. The resulting damage was severe to agriculture and to electric lines, and required the use of snow removal equipment and considerable reconstruction of transmission lines. The northern limits of the snow barely reached southern portions of the Province of Quebec. Other dates of remarkable May snows in New England were on the 11th in 1907, and the 20th in 1892. There was little or but brief relief from the cold and unfavorable weather at any time during the month, and vegetation of late heavy forest growth was retarded. In Boston it was recorded as the windiest May of record.

TEMPERATURE

The average monthly temperature for the Section, based on 114 records, was 52.2°, which is 3.0° below the mean for the past 58 years. The average temperature for the northern division was 50.4°; for the southern division, 54.1°. The highest monthly mean was 58.0° at Springfield, Mass.; the lowest was 45.5° at First Connecticut Lake, N. H. The highest recorded was 87° at Nashua, N. H. and Cornwall, Vt. on the 22d; the lowest was 24° at Woodstock, N.H. on the 10th and 12th, Bloomfield, Vt. on the 12th, and Lemington, Vt. on the 12th and 20th. The greatest monthly range was 60° at Bloomfield, Vt.; the least was 30° at Chatham, Mass. and Block Island, R.I.

PRECIPITATION

The average monthly precipitation for the Section, based on 194 records, was 6.01 inches, which is 2.64 inches above the mean for the past 58 years. The average precipitation for the northern division was 6.41 inches; for the southern division, 5.60 inches. The greatest monthly amount reported was 9.86 inches at Pinkham Notch, N. H.; the least was 3.30 inches at Slocum, R.I. The greatest amount in 24 hours was 3.48 inches at Pinkham Notch, N.H. on the 10-11th. The average number of days with .01 inch or more of precipitation was 18, which is 7 above the mean for the past 58 years.

The average snowfall for the northern division, based on 92 records, was 6.6 inches; for the southern division, based on 85 records, 0.9 inch; for the Section, based on 177 records, 3.9 inches, which is 3.6 inches above the mean for the past 58 years.

NOTE

On June 30, 1945, I shall be retired from the Weather Bureau. I would like to let each one of the various Cooperative Observers of the Bureau in New England know that I appreciate with real sincerity the truly generous contribution you have made to the work assigned to my supervision. My thanks are tendered to you personally for your help and for the association with you in perpetuating the recording of New England weather history.

G. H. NOYES.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 134 records, was northwest. The average velocity, based on the records at 14 stations, was 9.6 miles per hour, which is 0.3 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 46 percent of the possible amount, which is 10 percent below the mean.

Cloudiness was considerably above the mean. The average for the Section, based on 141 records, was 6 clear, 9 partly cloudy and 16 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 77 percent, which is 1 percent above the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.**)

Dates of Miscellaneous Phenomena

Auroras.— 8th, 11th, 12th.

Halos, lunar.— 22d.

Halos, Solar.— 2d, 3d, 8th, 12-15th, 20th, 22d, 24-26th.

Hail. — (dates and general location) — 6th, Berlin, Pinkham Notch, Wolfeboro Falls and Woodstock, N.H., Northfield and Searsburg Station, Vt., Pittsfield, Mass. and Storrs, Conn.; 22d, Bethlehem, Keene, Lakeport, and Newport, N.H., Cavendish, Craftsbury Common, East Barnet, Newfane, Northfield, and Waterbury (near), Vt.; 25th, Caribou and Fort Fairfield, Me.

Thunderstorms.— 1st, 4-8th, 12-19th, 21-23d, 25th, 27-30th.

Fog, dense.— 1-8th, 10th, 11th, 13-19th, 21-23d, 26-30th.

Frosts. — (latest date of killing frost in month)— In northern division, on progressive dates (depending upon susceptibility of locations) from 2d to 31st; in Berkshires of southern division and the more susceptible local areas of central Mass., eastern Conn. and R.I. on progressive dates from 10th to 26th; elsewhere in the southern division, last killing frost recorded during preceding two months.

Sleet. — (dates and general location) — Maine: 10th, 1; 11th, 3. New Hampshire: 3d, 2; 10th, 2; 11th, 1; 31st, 5. Vermont: 1st, 1; 2d, 1; 9th, 1; 31st, 2. Massachusetts: 10th, 10; 11th, 2. Rhode Island: None. Connecticut: 10th, 1; 11th, 1.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ᵃ,ᵇ,ᶜ, etc appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville: — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for May 1945

VOL. LVII. BOSTON, MASS., JUNE 1945. No. 6.

GENERAL SUMMARY

The unseasonably cool weather that prevailed in New England during May, 1945 continued into June, resulting in probably the coldest opening week of June in the records of the Weather Bureau. In Boston, the minimum temperature of 41° on the 1st was the lowest June temperature ever recorded at that station; and the mean temperature of 47° on the 5th established a record low daily mean temperature for that month. Freezing temperatures and killing frosts were recorded at many inland stations on each of the first three days of the month. Following the first week, temperatures rose gradually, and were generally above normal by the 11th, and continued mostly above normal thereafter to the close of the month. The excessive warmth accumulated during this latter period nearly counter-balanced the deficiency established earlier in the month, so that the average temperature for the Section as a whole was only a fraction of a degree below normal. On the 1st, traces of snow were recorded at several stations in extreme northern areas and in the higher elevations, a rare occurrence for June in these latitudes. Rainfall was considerably above normal for the Section as a whole, but there were extensive areas, particularly in central and northern Maine, extreme northern portions of New Hampshire and Vermont, and the southern margins of Rhode Island and Connecticut, where monthly totals were near or below normal. In these areas, crops and vegetation made good recovery and approached a normal condition for the season. Elsewhere, frequent and occasionally heavy showers, particularly in the valleys and the lowlands, hindered growth of crops and vegetation, necessitating some general replanting, and causing a reduction in acreage planted. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 63.6°, which is 0.5° below the mean for the past 58 years. The average temperature for the northern division was 61.9°; for the southern division, 65.4°. The highest monthly mean was 69.8° at Haverhill, Mass.; the lowest was 54.5° at Eastport, Me. The highest recorded was 100° at Brockton, Mass. on the 30th; the lowest was 24° at Lemington, Vt., on the 2d. The greatest monthly range was 66° at Bennington, Vt.; the least was 36° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 5.06 inches, which is 1.53 inches above the mean for the past 58 years. The average precipitation for the northern division was 4.56 inches; for the southern division, 5.58 inches. The greatest monthly amount reported was 10.55 inches at Peru, Mass.; the least was 1.50 inches at Newport, Vt. The greatest amount in 24 hours was 4.61 inches at Nantucket, Mass. on the 26-27th. The average number of days with .01 inch or more of precipitation was 15, which is 4 above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 131 records, was southwest. The average velocity, based on the records at 14 stations, was 8.2 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 53 percent of the possible amount, which is 6 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 138 records, was 8 clear, 11 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 78 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ᵃ,ᵇ,ᶜ, etc. appearing in the table indicate number of days missing; for example, ᵇ represents two days, etc.

† Post office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for June 1945

VOL. LVII. BOSTON, MASS., JULY 1945. No. 7.

GENERAL SUMMARY

New England's weather in July, 1945 was featured by persistent cloudiness and frequent fog, particularly in the coastal areas, also by the absence of any extended periods of excessive warmth. Although the first ten days of the month were substantially warmer than normal, the temperature at most stations reached the 90's on but one day (the 1st) of the month. In Boston, only one clear day was recorded during the month, and the registered amount of sunshine was 15% below the normal for July. During the first ten days, crops and vegetation made good growth, and all out-of-door activities were benifitted by favorable weather conditions. On or about the 10th, high barometric pressure developed off the North Atlantic coast and remained there quite constantly during the remainder of the month, adversely affecting weather conditions over New England. This pressure pattern brought about a considerably increased incidence of easterly winds from off the cold North Atlantic waters, producing below normal temperatures over New England during most of the time after the 10th. The temperature deficiency accumulated during this period approximately counter-balanced the excess established earlier in the month, consequently the average monthly temperature for the Section as a whole was very close to normal. Rainfall distribution was decidedly uneven, ranging from amounts of more than 13 inches in portions of the Berkshires to only slightly more than an inch in Rhode Island and the Cape Cod area. Heavy amounts were recorded elsewhere in western portions of Massachusetts, Vermont and Connecticut. Agriculture was adversely affected after the 10th by inadequate sunshine and warmth, and by too frequent and heavy showers in western New England and some interior localities. On the 20th, an unusually heavy rainstorm occurred in western Rutland County, Vermont, causing severe damage to highways, bridges, crops and livestock. On the 22d, a series of "cloudbursts" occurred over western Berkshire County, Massachusetts, causing the loss of two lives and greater property damage than the Vermont storm. Official rainfall records are not maintained in the immediate localities most severely affected by either of these two storms. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 110 records, was 68.9°, which is 0.2° below the mean for the past 58 years. The average temperature for the northern division was 67.6°; for the southern division, 70.4°. The highest monthly mean was 74.9° at Haverhill, Mass.; the lowest was 61.3° at Eastport, Me. The highest recorded was 97° at Fort Devens, Mass. on the 1st; the lowest was 35° at Woodstock, N.H., on the 12th. The greatest monthly range was 54° at Fitchburg, Mass., and Falls Village, Conn; the least was 25° at Nantucket, Mass. and Point Judith, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 185 records, was 4.72 inches, which is 0.95 inch above the mean for the past 58 years. The average precipitation for the northern division was 4.90 inches; for the southern division, 4.54 inches. The greatest monthly amount reported was 13.50 inches at South Egremont, Mass.; the least was 1.04 inches at New Bedford, Mass. The greatest amount in 24 hours was 4.90 inches at Stevenson Dam, Conn. on the 17-18th. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was southwest. The average velocity, based on the records at 14 stations, was 7.7 miles per hour, which is 0.5 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 57 percent of the possible amount, which is 4 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 137 records, was 10 clear, 11 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 81 percent, which is 3 percent above the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for July 1945

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVII. BOSTON, MASS., AUGUST 1945. NO. 8.

GENERAL SUMMARY

New England's weather during August, 1945 did not vary greatly from conditions normally experienced during that month. Rainfall frequency showed the greatest deviation, with an average of less than 8 days with measurable amounts, as compared with a normal of 10. In the northern division, the average rainfall total was only little more than half of normal. Storage of ground water and reservoirs at the end of the month, although lower than at the close of July, was well above normal. The average temperature for the Section as a whole was a bare 0.1° above normal. There were alternating brief periods of warmth and coolness, with a notable absence of sustained extreme warmth such as experienced in August of 1944. Agriculture, in general, was favored, and crops were making satisfactory progress towards maturity, although the advance was somewhat slowed after the 22d by the occurrence of rather unseasonably cool weather. Fields and pastures were in excellent condition through the month, and production of milk and eggs was unusually high. Sustained periods of fair and dry weather were especially favorable for harvesting and marketing of truck crops. On the whole, the month's weather was typical of late summer in New England. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 67.2°, which is 0.1° above the mean for the past 58 years. The average temperature for the northern division was 66.0°; for the southern division, 68.4°. The highest monthly mean was 72.8° at Haverhill, Mass.; the lowest was 59.6° at Somerset, Vt. The highest recorded was 98° at Vanceboro, Me. on the 12th; the lowest was 32° at Greenville, Me. and Vanceboro, Me. on the 24th. The greatest monthly range was 66° at Vanceboro, Me.; the least was 22° at Point Judith, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 188 records, was 2.62 inches, which is 1.11 inches below the mean for the past 58 years. The average precipitation for the northern division was 1.79 inches; for the southern division, 3.48 inches. The greatest monthly amount reported was 6.16 inches at New Haven, Conn.; the least was 0.40 inch at Lebanon, N. H. The greatest amount in 24 hours was 3.50 inches at Norwalk, Conn. on the 6th.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was southwest. The average velocity, based on the records at 14 stations, was 7.3 miles per hour, which is 0.5 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 62 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 132 records, was 13 clear, 11 partly cloudy and 7 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 80 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for August 1945

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVII. BOSTON, MASS., SEPTEMBER 1945. NO. 9.

GENERAL SUMMARY

New England's weather in September, 1945 was, perhaps, most noteworthy for the very uneven distribution of rainfall. The Connecticut River, from its mouth to southern New Hampshire, was an approximate dividing line between areas of above normal (to west and north) and subnormal (to east) monthly amounts, thus just about reversing the distribution pattern of the preceding month. Totals ranged from more than 9 inches in parts of northern Vermont to near half an inch in Barnstable County, Mass. The month was warmer than normal in all parts of the Section, with an unusually extended mild period from the 5th through the 15th. Much of the month's excess of warmth was accumulated during that period. Temperatures reached the 90's on the 7th and 8th over much of the Section. The first killing frosts of the season occurred on the 17th and 23d in the more susceptible places of the northern division, and overspread the Berkshires and northwestern Connecticut on the 30th. Light to heavy frosts occurred generally elsewhere on the 30th, terminating growth of tender vegetables practically throughout the Section. Harvesting was, perhaps, less favored than usual, especially in the northern division, due to the greater frequency of rain and less than normal sunshine. On the 1st, a tornado struck the township of North Windham, Me. at 5:30 P. M., E. S. T. Damage was confined to two farms, and consisted of some trees blown down and roofs torn from a barn and house. One person was injured. Damage was estimated at $7,500. Track of storm was apparently from northwest to southeast. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 62.8°, which is 2.5° above the mean for the past 58 years. The average temperature for the northern division was 60.3°; for the southern division, 65.3°. The highest monthly mean was 69.4° at New London, Conn.; the lowest was 54.9° at First Connecticut Lake, N. H. The highest recorded was 99° at Bangor, Me. on the 7th; the lowest was 23° at Vanceboro, Me. on the 23d and Woodstock, N. H. on the 30th. The greatest monthly range was 70° at Bangor, Me. and Woodstock, N. H.; the least was 29° at Point Judith, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 3.61 inches, which is 0.18 inch below the mean for the past 58 years. The average precipitation for the northern division was 4.91 inches; for the southern division, 2.31 inches. The greatest monthly amount reported was 9.67 inches at Craftsbury Common, Vt.; the least was 0.50 inch at North Truro, Mass. The greatest amount in 24 hours was 3.38 inches at Lincoln, N. H. on the 1st-2d. The average number of days with .01 inch or more of precipitation was 10, which is 1 above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was southwest. The average velocity, based on the records at 14 stations, was 8.6 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 51 percent of the possible amount, which is 6 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 142 records, was 11 clear, 7 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 83 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for September 1945

VOL. LVII. BOSTON, MASS., OCTOBER 1945. NO. 10

GENERAL SUMMARY

New England's weather in October, 1945 was marked by the usual manifestations of early fall merging into the more rigorous period of the year. The season's first general snowfall occurred on the 3d, a trace being recorded at most stations, and there were several subsequent occurrences of light snow of less general extent. Other occurrences of phenomena of a more local character included thunderstorms, hail, and sleet. Killing frost penetrated all portions of the Section by the 4th, with the exception of a few sheltered areas along the Massachusetts and Rhode Island coasts. There were two extended periods of subnormal temperature: from about the 9th through the 17th, and the 24th through the 29th. The temperature deficiency accumulated during these periods was hardly balanced during the milder periods of the month, so that the average monthly temperature was somewhat below normal. Monthly maxima occurred generally on the 19th, with readings in the upper 70's and lower 80's; monthly minima occurred on the 4th and 29th. The pattern of precipitation distribution, with respect to normal monthly totals, followed in general, that of the preceding month, with above normal amounts in the northern division, and subnormal amounts in the southern division. However, the difference in the monthly totals of the two divisions was not as great this month as in September. Ground water levels in all portions of the Section, and stream flow in the northern division were well above normal; stream flow in the southern division was, generally, somewhat below normal. Frequent showers during the first half of the month delayed general completion of harvesting until late in the month. At the close of the month, some hardy vegetables were still being harvested.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 47.8°, which is 1.6° below the mean for the past 58 years. The average temperature for the northern division was 45.2°; for the southern division, 50.7°. The highest monthly mean was 54.6° at Nantucket, Mass.; the lowest was 39.7° at First Connecticut Lake, N. H. The highest recorded was 86° at Shelburne Falls, Mass. on the 19th; the lowest was 15° at Bloomfield, Vt. on the 29th. The greatest monthly range was 62° at Dorset, Vt.; the least was 30° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 3.53 inches, which is 0.02 inch above the mean for the past 58 years. The average precipitation for the northern division was 4.41 inches; for the southern division, 2.65 inches. The greatest monthly amount reported was 7.90 inches at Waterbury (near), Vt.; the least was 1.53 inches at Millbury, Mass. The greatest amount in 24 hours was 4.03 inches at Farmington, Me. on the 7th. The average number of days with .01 inch or more of precipitation was 13, which is 4 above the mean for the past 58 years.

The average snowfall for the northern division, based on 93 records, was 0.5 inch; for the southern division, based on 93 records, trace; for the Section, based on 186 records, 0.3 inch, which is 0.1 inch above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 133 records, was northwest. The average velocity, based on the records at 14 stations, was 9.3 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 46 percent of the possible amount, which is 7 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 143 records, was 10 clear, 7 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 81 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras — 1st, 24th, 26-29th.

Halos lunar.— 15th.

Halos Solar.— 5th, 8th, 12th, 14th.

Hail. — (State, date, number of stations reporting)— Maine: 3d, 4. New Hampshire: 9th, 2. Vermont: 12th, 1. Massachusetts: 12th, 1. Rhode Island: 12th, 1. Connecticut: 3d, 1; 26th, 1.

Thunderstorms. — 2d, 3d, 7th, 9th, 12th, 13th, 19th, 22d, 31st.

Fog, dense.— 1st, 4-15th, 18-26th, 29-31st.

Frosts. — Killing frost on 1st or 4th in almost all parts of Section. No killing frost yet recorded in sheltered areas of Massachusetts and Rhode Island coasts.

Sleet. — (State, date, number of stations reporting) — Maine: 15th, 2; 16th, 1; 23d, 1; 24th, 2; 25th, 1. New Hampshire: 1st, 2; 9th, 2; 14th, 2; 16th, 1; 24th, 1; 26th, 1; 27th, 3; 31st, 1. Vermont: 14th, 1; 23d, 2; 24th, 1; 27th, 2. Massachusetts: 26th, 1. Rhode Island and Connecticut: None.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Lake Konomoc, New London.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for October 1945

VOL. LVII. BOSTON, MASS., NOVEMBER 1945. NO. 11.

GENERAL SUMMARY

The feature of New England's weather during November, 1945 was the very severe northeast storm of the 29th and 30th. In Boston, the northeast gale attending the storm attained a record November velocity of 63 miles per hour (sustained for a 5 minute period), while the average wind velocity for the day (midnight to midnight), 40.5 miles per hour, has probably never been equalled. The greatest force of the wind appeared to be concentrated along the northeast Massachusetts coast, and severe damage resulted in this area from inundation and heavy seas, despite the fact that the period of the storm coincided with that of the neaptide. The storm first appeared as a small low pressure area 70 miles northwest of Cape Hatteras early Wednesday morning (28th). It moved rapidly northward during the day, causing precipitation to spread northward through New England to northern Maine, and winds to increase over southern New England. From 7:30 P. M. Wednesday to 7:30 A. M. Thursday, the storm's center remained nearly stationary off the southern New Jersey coast, then changed its course to east-northeast, reaching a point about 60 miles south of central Long Island at 7:30 P. M. Thursday (29th). During this period, winds became strong and precipitation heavy over southern New England. From then on the course of the storm was almost due east, its rate of progress slow, and rain changed to snow in most sections except in the Cape Cod area. Winds gradually diminished during Friday (30th), while snow continued over most of New England on Friday and early Saturday. Snow depths varied greatly with distance from the coast. Along the immediate coast, they ranged from a trace to less than 4 inches, while in districts only a few miles to the west and north, depths of 8 to 16 inches were authoritatively recorded. Although several small and medium sized craft were destroyed in the gale, shipping in general, aided by timely warnings, managed to ride out the storm without great casualties. Press reports stated that 33 deaths were ascribed to the storm, mostly from highway accidents or over-exertion. Total monthly precipitation was above normal in all sections except extreme northern portions of Maine and New Hampshire, and was especially heavy in southeastern Massachusetts and Rhode Island. Temperature averaged somewhat above normal in nearly all portions of the Section.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 39.1°, which is 1.1° above the mean for the past 58 years. The average temperature for the northern division was 35.7°; for the southern division, 42.7°. The highest monthly mean was 47.4° at Nantucket, Mass.; the lowest was 28.8° at Caribou, Me. The highest recorded was 78° at Weston, Mass. on the 3d; the lowest was −3° at Presque Isle, Me. on the 29th. The greatest monthly range was 66° at Bloomfield, Vt.; the least was 35° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 190 records, was 5.34 inches, which is 1.78 inches above the mean for the past 58 years. The average precipitation for the northern division was 4.57 inches; for the southern division, 6.13 inches. The greatest monthly amount reported was 10.61 inches at East Wareham, Mass.; the least was 2.47 inches at Ft. Kent, Me. The greatest amount in 24 hours was 3.77 inches at Pembroke, Mass. on the 29-30th. The average number of days with .01 inch or more of precipitation was 14, which is 4 above the mean for the past 58 years.

The average snowfall for the northern division, based on 92 records, was 13.6 inches; for the southern division, based on 86 records, 7.8 inches; for the the Section, based on 178 records, 10.8 inches, which is 5.9 inches above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 130 records, was northwest. The average velocity, based on the records at 14 stations, was 10.4 miles per hour, which is 0.4 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 38 percent of the possible amount, which is 6 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 137 records, was 8 clear, 6 partly cloudy and 16 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 82 percent, which is 6 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Halos Solar.— 1st, 2d, 7th, 15th, 19th, 21st.

Hail.— (dates and general location)— 15th, Hartford, Conn.

Thunderstorms. — 8th, Kennebec and Franklin Counties, Me.; 19th, extreme southern Rhode Island.

Fog, dense.— 2-4th, 6-14th, 17-20th, 22d, 23d, 27-29th.

Frosts. — Killing frost penetrated sheltered and least susceptible places along Massachusetts and Rhode Island coast on 16th, 21st, 23d or 27th. Recorded earlier in season elsewhere in Section.

Sleet. — (by States and dates on which one or more stations reporting occurrence)—Maine: 4th, 12th, 17-23d. New Hampshire: 10-15th, 17th, 18th, 20th, 22d, 28-30th. Vermont: 11th, 16th, 17th, 20th, 22d, 28th, 29th. Massachusetts: 4th, 10th, 11th, 14th, 15th, 19th, 20th, 28-30th. Rhode Island: None. Connecticut: 4th, 10th, 17th, 28-30th.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [1] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; - Vermont - Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for November 1945

VOL. LVII. BOSTON, MASS., DECEMBER 1945. No. 12.

GENERAL SUMMARY

A series of coastal storms, bringing heavy precipitation and a record volume of snow for the month to the southern division, marked New England's weather in December, 1945. Most of the snow fell in the storms of the 19-20th and the 29th, but the heavy accumulations of each were materially reduced by subsequent heavy rains on the 25-26th and 30-31st. The average snowfall in the southern division, 24.7 inches, compares with a normal of 7.8 inches. On the 6-7th, a heavy rainstorm produced spectacular 24-hour amounts along the northern borders of Massachusetts Bay, with more than 6 inches recorded at Beechwood and Gloucester. At Beechwood, 6.59 inches were recorded, and this is probably a record 24-hour fall for the Section in December. In the northern division, precipitation averaged close to normal, while snowfall was substantially less than normal. The month was considerably colder than normal and marked the fourth consecutive December of subnormal temperature. From the 12th through the 23d, the temperature remained below freezing over most of the Section, with frequent subzero readings in northern and western areas. The temperature deficiency accumulated during that period accounted in large measure for the monthly departure from normal. Other elements of weather, including wind, sunshine and cloudiness, did not vary greatly from usual December averages. At the close of the month, the snow cover was rather uneven, ranging generally from a trace to 10 inches or more in the southern division, and to more than 20 inches in northern New Hampshire.

TEMPERATURE

The average monthly temperature for the Section, based on 117 records, was 22.0°, which is 4.3° below the mean for the past 58 years. The average temperature for the northern division was 18.8°; for the southern division, 25.3°. The highest monthly mean was 32.6° at Provincetown, Mass.; the lowest was 13.7° at Caribou, Me. The highest recorded was 54° at Providence, R. I. on the 8th; the lowest was −23° at Bloomfield, Vt. on the 21st. The greatest monthly range was 71° at Bennington, Vt.; the least was 38° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 4.50 inches, which is 1.17 inches above the mean for the past 58 years. The average precipitation for the northern division was 3.18 inches; for the southern division, 5.84 inches. The greatest monthly amount reported was 10.88 inches at Beechwood, Mass.; the least was 0.96 inch at Essex Junction, Vt. The greatest amount in 24 hours was 6.59 inches at Beechwood, Mass. on the 6-7th. The average number of days with .01 inch or more of precipitation was 10, which is the mean for the past 58 years.

The average snowfall for the northern division, based on 89 records, was 10.8 inches; for the southern division, based on 90 records, 24.7 inches; for the Section, based on 179 records, 17.8 inches, which is 6.7 inches above the mean for the past 58 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 138 records, was northwest. The average velocity, based on the records at 14 stations, was 10.2 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 44 percent of the possible amount, which is the mean.

Cloudiness was near the mean. The average for the Section, based on 144 records, was 11 clear, 6 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 80 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire – First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; – Vermont – Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.: – Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; – Connecticut – Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

[6] Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for December 1945

VOL. LVII. BOSTON, MASS., ANNUAL, 1945. No. 13.

GENERAL SUMMARY.

The many varieties and extremes of weather which are usually experienced in New England during the course of a year were much in evidence during 1945. Outstanding events during the year were: A very cold January, and the heavy snow storms of January 8th and February 8-9th; the warmest March and April of record and the consequent extraordinary advance of vegetation; remarkably late heavy snow storm of May 10-11th; the record cold opening week of June; a tornado in township of North Windham, Me. on September 1st; very severe northeast storm of November 29-30th; spectacular 24-hour rainfall along northern border margins of Massachusetts Bay on December 6-7th.

The year opened with warm gales, heavy rains and barometric pressure under 29 inches. Immediately thereafter, temperatures dropped to subnormal levels, and it continued cold the remainder of January and through the first three weeks of February. A snowstorm on January 8th very thoroughly enveloped the Section with a cover which, maintained by several subsequent snowstorms of lesser intensity and another very severe snowstorm of February 8-9th, lasted to the end of February over most of the Section. There began on February 22d a period of above normal warmth, of record duration and degree, which continued throughout March and to the 21st of April. The warmest March and April of record were thus established, and vegetation had advanced alarmingly to some 5 to 6 weeks ahead of season with consequent forebodings of frosts later to kill some of the more tender plants and vegetation. Subnormal temperatures set in on April 22d, and thence until after the first week of June cold weather with frequent rain and much cloudiness predominated. A remarkably late season heavy snowstorm occurred on May 10-11th, with more than 10 inches recorded over a large area from the Berkshires to the Rangeley and Moosehead Lakes Region of Maine. The opening week of June was the coldest for the season

(Continued on page 102)

The average annual temperature for the Section was 46.2°, which is 0.3° above the mean for the past 58 years. The average temperature for the northern division was 43.6°; for the southern division, 48.9°. The highest annual mean temperature was 52.3° at Providence, R.I.; the lowest was 38.0° at First Connecticut Lake, N.H. The highest temperature reported was 100° at Brockton, Mass. on June 30th; the lowest was −32° at Lemington, Vt. on January 11th. The annual range for New England was 132°; the greatest local annual range was 124° at Bangor, Me.; the least local annual range was 83° at Chatham, Mass. and Nantucket, Mass.

The average annual precipitation for the Section was 49.16 inches, which is 7.09 inches above the mean for the past 58 years. The average precipitation for the northern division was 48.44 inches; for the southern division, 49.97 inches. The average annual snowfall for the northern division, was 91.5 inches; for the southern division, 78.8 inches; and for the Section, 86.0 inches, which is 22.2 inches above the mean for the past 58 years. The greatest annual precipitation was 69.21 inches at Norfolk, Conn.; the least annual amount was 37.11 inches at Presque Isle, Me. The greatest local monthly amount was 13.50 inches at South Egremont, Mass. in July; the least local monthly amount was 0.40 inch at Lebanon, N.H. in August. The greatest amount in any 24 hours was 6.59 inches at Beechwood, Mass. on December 6-7th. The average number of days with .01 inch or more of precipitation was 144, which is 21 above the mean for the past 58 years.

The prevailing direction of the wind was northwest. The average velocity was 9.4 miles per hour, which is 0.6 mile per hour below the mean. The maximum velocity recorded during the year was 80 miles per hour from the south on January 1st at Blue Hill, Mass.

Sunshine averaged 52 percent of the possible amount, which is 1 percent below the mean for the past 52 years. Cloudiness was considerably above the mean; the average for the Section was 123 clear, 97 partly cloudy and 145 cloudy days.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

(Continued from page 97)

ever recorded, with killing frosts occurring at many inland stations on each of the first three days. At the end of the first week of June, the condition of agriculture was somewhat behind the normal advance, the earlier gains having been wiped out by adverse weather since the latter part of April. With too frequent rains, occasionally heavy, in most parts of the Section during June, the crop advance still lagged at the end of the month, except in northern and southern marginal areas where rainfall totals and frequency were close to normal. Unfavorable conditions continued through July with much cloudiness and fog and with little sunshine, particularly along the coast, and with frequent showers in the interior sections. There was a noticeable absence of oppressive heat during July and August. The weather during August was more typical of late summer in New England, and agriculture responded satisfactorily to somewhat more favorable conditions. On September 1st, a tornado struck the township of North Windham, Me., injuring 1 person, and damaging several wooden structures. The first killing frosts of the season occurred on September 17th and 23d in the more susceptible places of the northern division, and by October 4th had covered nearly all of the Section. October was marked by the usual manifestations of late fall merging into the more rigorous season of the year, with first general occurrences of sleet, snow and hard freezing. The severe storm of November 29-30th featured the weather of that month. The storm was attended by winds of record November velocity (63 miles per hour) in Boston, and produced a snow cover ranging from a trace along the immediate southeast coast to more than 20 inches in areas of northeastern Massachusetts but a few miles removed from the shore. December's weather was notable for a series of coastal storms bringing heavy precipitation and a record volume of snow to the southern division. On the 6-7th, spectacular 24-hour rainfall of record December proportions occurred at Beechwood, Mass. (6.59 inches) and Gloucester, Mass. (6.25 inches). Conditions for travel and transportation during the month were particularly hazardous and uncertain. At the close of the year, the snow cover was rather uneven, ranging generally from a trace to 10 inches or more in the southern division, and to more than 20 inches in northern New Hampshire.

VOL. LVIII. BOSTON, MASS., JANUARY 1946. No. 1.

GENERAL SUMMARY

An extended period of mild weather, frequently referred to as the "January thaw," was a feature of New England's weather during January, 1946. This mild period lasted from the 4th through the 12th over most of the Section, completely removing the snow cover over much of the southern division, and materially reducing the cover over northern New England. During the remainder of the month, cold weather predominated, and the accumulated temperature deficiency overcame the excess established during the mild period, so that the temperature for the month, for the Section as a whole, was fractionally subnormal. Monthly maximum temperatures occurred generally on the 6th and 7th; minima, on the 16th, 20th, 23d and 27th. Precipitation for the Section as a whole was slightly under normal, and was fairly evenly distributed. In the northern division, precipitation was nearly all in the form of snow, so that the total volume of snow for the month was considerably above normal. Stream flow continued above normal over the entire area, but at the end of the month was just about normal. Ground water levels in most Massachusetts observation wells dropped during January, but continued at high stages for the time of year. Other elements of weather, including frequency of precipitation, sunshine and cloudiness, did not vary importantly from normal. At the close of the month, the ground was bare in parts of southern Rhode Island; elsewhere in the southern division, the snow cover ranged in depth from 1 to 14 inches; in the northern division, to more than 40 inches in north-central areas.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 118 records, was 21.9°, which is 0.4° below the mean for the past 59 years. The average temperature for the northern division was 16.8°; for the southern division, 27.0°. The highest monthly mean was 32.9° at Nantucket, Mass.; the lowest was 8.4° at Caribou, Me. The highest recorded was 61° at Lake Cochituate, Mass. on the 7th and 8th, and at Sandwich, Mass. on the 6th; the lowest was −32° at Fort Kent, Me. on the 15th. The greatest monthly range was 86° at Lemington, Vt.; the least was 39° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 190 records, was 3.10 inches, which is 0.31 inch below the mean for the past 59 years. The average precipitation for the northern division was 2.92 inches; for the southern division, 3.27 inches. The greatest monthly amount reported was 5.57 inches at Pinkham Notch, N. H.; the least was 1.12 inches at Bethlehem, N. H. The greatest amount in 24 hours was 2.62 inches at Pinkham Notch, N. H. on the 24-25th. The average number of days with .01 inch or more of precipitation was 11, which is the mean for the past 59 years.

The average snowfall for the northern division, based on 88 records, was 27.9 inches; for the southern division, based on 85 records, 14.7 inches; for the Section, based on 173 records, 21.4 inches, which is 5.7 inches above the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 138 records, was northwest. The average velocity, based on the records at 14 stations, was 10.4 miles per hour, which is 0.6 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 46 percent of the possible amount, which is 1 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 143 records, was 9 clear, 8 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 77 percent, which is the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters a, b, c, etc appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. • T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for January 1946

VOL. LVIII. BOSTON, MASS., FEBRUARY 1946. NO. 2.

GENERAL SUMMARY

New England's weather during February, 1946, was typical of late winter in this Section, with alternating brief periods of above normal and subnormal temperatures, and precipitation close to the average. Although monthly minimum temperatures did not reach the extremes often experienced during February, the average temperature for the month was somewhat below normal in nearly all portions of the Section. Highest monthly temperatures were recorded on the 14th, with readings near 60°; monthly minima occurred on various dates including the 4th, 5th, 16th and 22d. The heaviest snowstorm of the month occurred on the 19-20th, leaving deposits of new snow ranging from about 5 to 8 inches along the coast, and to more than 14 inches over interior portions of the Section. The total volume of snow during the month was slightly greater than normal. At the close of the month, total depth of snow on the ground ranged, roughly, as follows: less than 10 inches from central Massachusetts southward; about 10 to 20 inches from western Vermont through northern Massachusetts and adjoining portions of New Hampshire, and along the Maine coast; elsewhere, from 20 to 35 inches or more. At Pinkham Notch, N. H., the depth was 62 inches. Other elements of weather including cloudiness, sunshine, wind and humidity, did not vary importantly from normal monthly averages. The occurrence of sleet on the 27th was unusually widespread throughout the Section.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 116 records, was 20.5°, which is 2.1° below the mean for the past 59 years. The average temperature for the northern division was 15.8°; for the southern division, 25.4°. The highest monthly mean was 30.9° at Block Island, R. I,; the lowest was 7.0° at First Connecticut Lake, N. H. The highest recorded was 61° at Rutland, Vt. on the 14th; the lowest was −32° at First Connecticut Lake, N. H. on the 5th. The greatest monthly range was 87° at Berlin, N. H.; the least was 34° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 189 records, was 2.96 inches, which is 0.11 inch below the mean for the past 59 years. The average precipitation for the northern division was 2.79 inches; for the southern division, 3.13 inches. The greatest monthly amount reported was 5.73 inches at Ellsworth, Me.; the least was 1.57 inches at Gilman, Vt. The greatest amount in 24 hours was 1.78 inches at Jefferson, Mass. on the 19-20th. The average number of days with .01 inch or more of precipitation was 10, which is 1 above the mean for the past 59 years.

The average snowfall for the northern division, based on 90 records, was 22.7 inches; for the southern division, based on 85 records, 14.2 inches; for the Section, based on 175 records, 18.6 inches, which is 2.1 inches above the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 136 records, was northwest. The average velocity, based on the records at 14 stations, was 11.6 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 54 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 142 records, was 10 clear, 7 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 74 percent, which is 1 percent below the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [1] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for February 1946

VOL. LVIII. BOSTON, MASS., MARCH 1946. NO. 3.

GENERAL SUMMARY

The weather of March, 1946, in New England was extraordinarily similar to that of the corresponding month of 1945. In both months the mean temperature was higher than in any previous March, and precipitation, including snowfall, was far below normal. The mean monthly temperature of this March (1946), 41.5°, was the highest ever recorded for March in New England, and exceeded the record of the preceding March by 0.8°. At Boston, Providence, and a number of other stations, the mean temperature for the month was actually higher than the normal mean temperature for *April*. With but few exceptions, every day of the month was warmer than normal, and the monthly mean was more than 9° above normal. On the 29th, readings reached the 80's over nearly all of the Section except in extreme northern portions and localities affected by ocean air. The highest recorded on that date was 87° at Durham, N. H., an all time record for March in the northern division. A rather substantial snow cover which existed at the beginning of the month over most of the Section was practically eliminated by the middle of the month over southern and central areas. In extreme northern portions of Maine, New Hampshire, and Vermont, a few inches of snow still remained at the end of the month on northern slopes and in wooded areas. In the northern division, the average snowfall was just an inch, the least ever recorded there in March; in the southern division, total snowfall averaged but half an inch. Precipitation was infrequent and totalled less than half of normal in each of the six States. Under these favorable conditions, the threat of floods began to diminish early in the month, and was largely eliminated by mid-month. The unseasonable warmth produced a remarkable agricultural advance, estimated at approximately three weeks ahead of season. The average percentage of possible sunshine for the Section as a whole was 72, probably the highest ever recorded in March. At Nantucket, Mass., there were 15 days on which 100 percent of sunshine was recorded, and at other stations equipped to record sunshine, the number was generally more than 10.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 116 records, was 41.5°, which is 9.1° above the mean for the past 59 years. The average temperature for the northern division was 38.7°; for the southern division, 44.5°. The highest monthly mean was 48.4° at Springfield, Mass. and Providence, R. I.; the lowest was 28.4° at Caribou, Me. The highest recorded was 87° at Durham, N. H. on the 29th; the lowest was −16° at Lemington, Vt. on the 1st. The greatest monthly range was 94° at Lemington, Vt.; the least was 36° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 1.53 inches, which is 2.08 inches below the mean for the past 59 years. The average precipitation for the northern division was 1.39 inches; for the southern division, 1.67 inches. The greatest monthly amount reported was 2.51 inches at Machias, Me.; the least was 0.47 inch at Bethlehem, N. H. The greatest amount in 24 hours was 1.70 inches at Peru, Vt. on the 8-9th. The average number of days with .01 inch or more of precipitation was 7, which is 4 below the mean for the past 59 years.

The average snowfall for the northern division, based on 87 records, was 1.0 inch; for the southern division, based on 88 records, 0.5 inch; for the Section, based on 175 records, 0.8 inch, which is 10.2 inches below the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 131 records, was southwest. The average velocity, based on the records at 14 stations, was 9.6 miles per hour, which is 1.8 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 72 percent of the possible amount, which is 19 percent above the mean.

Cloudiness was considerably below the mean. The average for the Section, based on 137 records, was 16 clear, 8 partly cloudy and 7 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 73 percent, which is 1 percent below the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for March 1946

GENERAL SUMMARY

Weather during April, 1946, in New England was slightly colder and drier than normal. Following the record warmth of March, and in the absence of occasional summer-like warmth usually experienced in April, there was left a general impression of an unusually cold and backward month. This impression is not fully corroborated by statistics. Another point of interest is that in Boston and at a number of other stations, the mean temperature of March was actually higher than that of April, an anomaly that has never before occurred within the records of the Boston station. Rainfall, though mostly light, occurred with adequate frequency, restoring favorable condition of the soil. Light to heavy frosts early in the month caused limited damage to orchards in low-lying areas. Fruit buds, in general, were not advanced sufficiently at that time to be injured by frost. At the end of the month, the condition of crops and vegetation was near normal, the two to three weeks out-of-season advance, prevailing at the end of March, having been lost during the month, due to inadequate sunshine and warmth. Stream flows were considerably below normal, due, principally, to the fact that nearly all of the snow cover had melted during March, and that streams were already below normal at the beginning of the month. Deficiency in precipitation was also a contributing factor. Water storage in major reservoirs was, in general, somewhat above normal at the end of the month.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 115 records, was 42.3°, which is 1.4° below the mean for the past 59 years. The average temperature for the northern division was 40.1°; for the southern division, 44.6°. The highest monthly mean was 47.6° at Providence, R. I.; the lowest was 34.0° at First Connecticut Lake, N. H. The highest recorded was 86° at Adams, Mass. on the 23d; the lowest was 0° at First Connecticut Lake, N. H. on the 1st. The greatest monthly range was 78° at Bloomfield, Vt.; the least was 32° at Nantucket, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 2.71 inches, which is 0.63 inch below the mean for the past 59 years. The average precipitation for the northern division was 2.84 inches; for the southern division, 2.58 inches. The greatest monthly amount reported was 6.35 inches at Eastport, Me.; the least was 1.43 inches at Montpelier, Vt. The greatest amount in 24 hours was 2.21 inches at Eastport, Me. on the 9-10th. The average number of days with .01 inch or more of precipitation was 12, which is 2 above the mean for the past 59 years.

The average snowfall for the northern division, based on 89 records, was 5.7 inches; for the southern division, based on 89 records, 1.1 inches; for the Section, based on 178 records, 3.4 inches, which is 0.7 inch below the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 137 records, was northwest. The average velocity, based on the records at 14 stations, was 10.5 miles per hour, which is 0.3 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 48 percent of the possible amount, which is 6 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 142 records, was 8 clear, 9 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 70 percent, which is 3 percent above the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for April 1946

NEW ENGLAND SECTION

W. H. TRACY

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR; (NOT STAMPS).
REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVIII. BOSTON, MASS., MAY 1946. NO. 5.

GENERAL SUMMARY

Excessive rainfall, inadequate sunshine, and slightly subnormal temperature marked New England's weather during May, 1946. The effect of these conditions was unfavorable to agriculture in particular, and to all out-of-door activities in general. There were, on the average, fifteen days on which measurable precipitation occurred, which compares with a normal of eleven. While monthly totals of rainfall in Maine averaged only slightly greater than normal, they were from about 35 to 70 percent above normal in the other five States of the Section. Greatest monthly totals were recorded in Connecticut where 4.14 inches of rain were measured in 24 hours at Norwalk during the heavy rains of the 26-28th. Lowlands, in general, were too wet to be worked much of the time, and crop growth was retarded by insufficient sunshine and warmth. The hay crop, however, made good progress, and pasture lands were in favorable condition. Water in storage in major reservoirs increased during the month, and ground water levels at the end of the month were above average for this time of year. Temperatures on the 3d reached rather low levels, with sub-freezing and frosts recorded over nearly all portions of the Section. Frost damage was limited to some fruit buds. Frosts occurring at later dates caused only light damage in limited areas. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 113 records, was 54.1°, which is 1.1° below the mean for the past 59 years. The average temperature for the northern division was 52.4°; for the southern division, 55.9°. The highest monthly mean was 59.6° at Haverhill, Mass.; the lowest was 47.0° at First Connecticut Lake, N. H. The highest recorded was 92° at Franklin, N. H. on the 25th; the lowest was 14° at Bloomfield, Vt. on the 3d. The greatest monthly range was 71° at Bloomfield, Vt.; the least was 35° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 5.01 inches, which is 1.61 inches above the mean for the past 59 years. The average precipitation for the northern division was 4.26 inches; for the southern division, 5.75 inches. The greatest monthly amount reported was 10.78 inches at Norwalk, Conn.; the least was 2.50 inches at Hiram, Me. The greatest amount in 24 hours was 4.14 inches at Norwalk, Conn. on the 26-27th. The average number of days with .01 inch or more of precipitation was 15, which is 4 above the mean for the past 59 years.

The average snowfall for the northern and southern divisions, and for the Section was none, although Trace was recorded at a few stations. Normal snowfall for the Section for May is 0.3 inch.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was southwest. The average velocity, based on the records at 14 stations, was 9.6 miles per hour, which is 0.3 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 51 percent of the possible amount, which is 5 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 139 records, was 9 clear, 8 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 73 percent, which is 3 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras.— 6th, 7th, 9-12th, 21-23d.

Halos, lunar.— 10th, 11th, 13th, 14th.

Halos, Solar.— 2d, 4th, 7th, 14th, 20th, 25th, 26th, 30th.

Hail. — (State, date, number of stations reporting)—Maine: 5th, 2; 7th, 1; 13th, 2; 28th, 3. New Hampshire: 6th, 4; 8th, 1; 9th, 4. Vermont: 9th, 2. Massachusetts: 8th, 2; 9th, 1. Rhode Island and Connecticut: None.

Thunderstorms. — 6th, 7th, 9th, 11-13th, 16-21st, 23d, 25-28th, 31st.

Fog, dense.— 1st, 5th, 6th, 8th, 9th, 11-13th, 15-21st, 23-30th.

Frosts.— (latest date of killing frost in month) —On progressive dates, depending upon susceptibility of locations—Northern division: 3d, 4th, 5th, 9th, 11th, 13th, 14th, 23d, 29th, 30th, 31st. Southern division: 3d, 4th, 9th, 10th, 11th, 14th, 15th, 30th (killing frost on 30th in southern division limited to most susceptible exposures in southeast).

Sleet.—5th, Augusta, Bangor, East Winthrop, Eustis and Greenville, Me. and Pinkham Notch, N.H.; 31st, Caribou, Me.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville: — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for May 1946

VOL. LVIII. BOSTON, MASS., JUNE 1946. No. 6.

GENERAL SUMMARY

Unusually violent thunderstorms during the evening of the 8th were the outstanding weather event of June, 1946, in New England. While occurring generally over the Section, the storms were most severe over the southern division where considerable damage was caused by wind, lightning and hail. There were many reports of trees blown down, taking wires with them; hail damage to shade coverings for tobacco and to cranberry vines; and many windows broken by hail and winds reaching over 50 miles per hour in gusts. In Boston, a brief heavy shower produced 0.43 inch of rain in 5 minutes, a record fall for that period in June. Another feature of the month was the extended period of warm weather which began on the 24th and continued to the end of the month. The excess of temperature above normal accumulated during this period did not quite counterbalance the deficiency established earlier, particularly during the opening week, so that the mean monthly temperature for the Section was a fraction of a degree below normal. Rainfall was spotted and unevenly distributed. Monthly totals were generally somewhat below normal, except in central and western Massachusetts and adjoining portions of southern Vermont. On the 27th, at Petersham, Mass., 4.20 inches of rain were recorded. In general, however, most of the rainfall over the Section fell during the first half of the month, while in the latter half, moisture was deficient to the extent that conditions were approaching drought stage at the close of the month. E.S.

TEMPERATURE

The average monthly temperature for the Section, based on 108 records, was 63.6°, which is 0.5° below the mean for the past 59 years. The average temperature for the northern division was 62.3°; for the southern division, 64.9°. The highest monthly mean was 69.6° at Haverhill, Mass.; the lowest was 56.0° at Eastport, Me. The highest recorded was 98° at Winslow, Me. on the 29th, and Haverhill, Mass. on the 25th; the lowest was 25° at Somerset, Vt. on the 19th. The greatest monthly range was 68° at Bloomfield, Vt.; the least was 31° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 181 records, was 3.06 inches, which is 0.46 inch below the mean for the past 59 years. The average precipitation for the northern division was 2.53 inches; for the southern division, 3.59 inches. The greatest monthly amount reported was 7.81 inches at Petersham, Mass.; the least was 0.67 inch at Machias, Me. The greatest amount in 24 hours was 4.20 inches at Petersham, Mass. on the 27th. The average number of days with .01 inch or more of precipitation was 10, which is 1 below the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 123 records, was southwest. The average velocity, based on the records at 14 stations, was 8.4 miles per hour, which is 0.5 mile per hour below the mean.

The sunshine, based on the records at 10 stations, averaged 66 percent of the possible amount, which is 7 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 132 records, was 13 clear, 9 partly cloudy and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 12 stations, was 73 percent, which is 2 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras.— 18th, 19th, 28th

Halos, lunar.— 8-13th.

Halos, Solar.— 3d, 7th, 15th, 22d.

Hail.— (State, date, number of stations reporting)—Maine: 4th, 1; 8th, 1. New Hampshire: 4th, 4; 5th, 4; 8th, 2; 27th, 1. Vermont: 5th, 10; 8th, 3. Massachusetts: 5th, 8; 8th, 10; 11th, 2; 28th, 1. Rhode Island: 5th, 1. Connecticut: 5th, 2; 8th, 2; 11th, 1.

Thunderstorms.— 1st, 3d-9th, 11-13th, 17th, 18th, 21st, 22d, 24-30th.

Fog, dense.— 1st-9th, 11-15th, 17-30th.

Sleet.— None.

Frosts, killing.—(latest date of, or latest date with minimum temperature 32° or lower—1st and 2d, in northern Maine areas of greatest susceptibility; 3d, vicinity of Turners Falls, Mass.; 19th, in susceptible places of northern New Hampshire and eastern and southern Vermont.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning, recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for June 1946

REMITTANCE PAYABLE TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, D. C.

VOL. LVIII. BOSTON, MASS., JULY 1946. No. 7.

GENERAL SUMMARY

The extended period of dry weather in New England, which began about June 22d, was temporarily broken by general moderate to heavy showers on July 2d. Following that date, however, there was no further substantial rain over most of the Section until the 21st, and particularly over central and southern New England with the exception of the Cape Cod area. Lack of adequate rainfall became increasingly serious, and near-drought conditions prevailed by mid-month. Widespread agricultural damage was reported, with crops stunted, and, in some cases, severely damaged, and fields and pastures browned. Moderate to heavy rain from the 21st to the 23d brought an end to the drought, and produced sufficient soil moisture to begin agricultural recovery which was further aided by additional rainfall near the end of the month. The month was moderately cool with temperatures averaging slightly below normal generally throughout the Section. Monthly minima were recorded on the 16th and 17th, with temperatures approaching record low readings for the month, and, in some cases, establishing new record monthly minima. Freezing or subfreezing temperatures with heavy frost occurred on the 16th at a few stations in northern New Hampshire and in the mountain valleys of southern Vermont. Highest monthly temperatures, in the middle and upper 90's, were generally recorded on the 19th and 20th. Other elements of the weather, including cloudiness, sunshine and wind, did not vary importantly from the normal. A tornado, apparently not fully developed, struck at Concord, N.H. on the 23d at 11:15 a.m., E.S.T. One death was reported, and property damage was estimated at $60,000. E.S.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 67.9°, which is 1.2° below the mean for the past 59 years. The average temperature for the northern division was 66.3°; for the southern division, 69.6°. The highest monthly mean was 73.1° at Haverhill, Mass.; the lowest was 60.4° at Eastport, Me. The highest recorded was 99° at North Bridgton, Me. and Lowell, Mass. on the 19th, and at Haverhill, Mass. on the 19th and 20th; the lowest was 30° at Bloomfield, Vt. on the 16th. The greatest monthly range was 64° at Woodstock, N.H.; the least was 25° at Block Island, R.I.

PRECIPITATION

The average monthly precipitation for the Section, based on 185 records, was 3.24 inches, which is 0.52 inch below the mean for the past 59 years. The average precipitation for the northern division was 3.22 inches; for the southern division, 3.27 inches. The greatest monthly amount reported was 7.19 inches at Barkhamsted, Conn.; the least was 0.71 inch at Brockton, Mass. The greatest amount in 24 hours was 3.99 inches at Westfield, Mass. on the 23d. The average number of days with .01 inch or more of precipitation was 8, which is 3 below the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 127 records, was southwest. The average velocity, based on the records at 14 stations, was 8.1 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 62 percent of the possible amount, which is 1 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 134 records, was 14 clear, 9 partly cloudy and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is 2 percent below the mean.

Dates of Miscellaneous Phenomena

Auroras.— 7th, 8th, 26-28th

Halos, lunar.— 14th, 15th.

Halos, Solar.— 2d, 8th, 13th, 15th, 18th, 25th, 31st.

Hail. — 3d, Brunswick, Me.; 20th, Chatham, Mass.; 30th, Fitchburg and Jefferson, Mass.

Thunderstorms. — 1-4th, 6-10th, 12-15th, 19-25th, 27th, 29-31st.

Fog, dense.— 1-14th, 16-19th, 21-31st.

Frosts. — On 16th, heavy frosts reported at Randolph, Woodstock and York Pond, N.H. and Searsburg Station and Somerset, Vt.

Tornado.— Reported at Concord, N.H (one-third mile northwest of Weather Bureau Office) on 23d at 11:15 a.m., E.S.T. One person killed, and property damage estimated at $60,000.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for July 1946

VOL. LVIII. BOSTON, MASS., AUGUST 1946. NO. 8.

GENERAL SUMMARY

Weather in New England during August, 1946, can be characterized as wet and cool. Rainfall during the month was exceptionally heavy from Cumberland County, Me., southward along the New Hampshire and northeast Massachusetts coast, and over southeastern Massachusetts and Rhode Island. Total monthly amounts were in excess of 10 inches at most stations in that area with greatest monthly amounts recorded at Sandwich, Mass., 17.85 inches, and Fall River, Mass., 16.10 inches. New record high monthly totals were established at these and a number of other stations, particularly in southeastern Massachusetts and Rhode Island. Frequent heavy showers during the month produced floods of varying extent and damage. Two of the more noteworthy occurred on the 7th and 26-27th. That of the 7th occurred at many localities of southeastern Massachusetts and Rhode Island as a result of a rainstorm of great intensity which lasted for about 12 hours. Damage was heavy and widespread, but no estimate of total loss is available. The flood of the 26-27th inundated an area along the Maine coast from York Harbor to Wells, and was produced by a rainstorm described as a "cloudburst" which occurred during the evening of the 26th at the time of an incoming spring tide. Damage attributable to the flood was estimated at a quarter million dollars with most of the loss concentrated at the amusement center of York Beach. Other rainstorms which contributed appreciably to the month's totals occurred on the 1st-2d, 19th and 29th. At Sandwich, Mass., there were recorded 7 days on which more than an inch of rain was recorded, including 3 days on which more than 2 inches of rain fell. In other parts of the Section, monthly rainfall totals were above normal except in portions of northern and eastern Maine, southern Vermont and western portions of Massachusetts and Connecticut. The month was persistently cool with but few breaks, and there were reports of freezing or subfreezing temperatures on the 30th and 31st in parts of Vermont, and on the 31st at Woodstock, N. H.

TEMPERATURE

The average monthly temperature for the Section, based on 112 records, was 64.6°, which is 2.4° below the mean for the past 59 years. The average temperature for the northern division was 63.4°; for the southern division, 66.0°. The highest monthly mean was 68.9° at Springfield, Mass.; the lowest was 57.6° at Somerset, Vt. The highest recorded was 94° at Farmington, Me. on the 9th; the lowest was 29° at Somerset, Vt. on the 31st. The greatest monthly range was 61° at Bennington, Vt.; the least was 24° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 6.30 inches, which is 2.52 inches above the mean for the past 59 years. The average precipitation for the northern division was 5.22 inches; for the southern division, 7.35 inches. The greatest monthly amount reported was 17.85 inches at Sandwich, Mass.; the least was 1.98 inches at Chester, Mass. The greatest amount in 24 hours was 6.93 inches at Wood River Junction, R. I. on the 7th. The average number of days with .01 inch or more of precipitation was 14, which is 4 above the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 126 records, was southwest. The average velocity, based on the records at 14 stations, was 7.6 miles per hour, which is 0.2 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 48 percent of the possible amount, which is 12 percent below the mean.

Cloudiness was considerably above the mean. The average for the Section, based on 138 records, was 8 clear, 10 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 85 percent, which is 4 percent above the mean.

NOTE: Observations taken at 7:30 a. m. E.S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning. recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for August 1946

VOL. LVIII. BOSTON, MASS., SEPTEMBER 1946. No. 9.

GENERAL SUMMARY

In marked contrast to the cool and rainy weather of the preceding month, September, 1946, in New England was a month of prolonged mild and pleasant weather, marred only by a daylong heavy rainstorm at the very end of the month. During the first three weeks, there were generally but two or three days on which measurable rainfall occurred, while the average for the entire month was only six as against a normal of nine. As a note of interest, in the first 29 days of the month in Boston, measurable rain occurred during only 3 or 4 of the daylight hours for this entire period. On the 30th, a deepening wave on a cold front passing over New England produced widespread heavy rain over most of the Section. At Greenville, Me., 6.01 inches was recorded in the 24 hours preceding 1:30 a. m. of October 1st, and at West Rutland, Mass., 5.32 inches in approximately the same 24-hour period. At many stations, and in particular those at which observations are taken in the morning, the amount of rainfall which occurred from the time of observation on the 30th until midnight of the 30th is not included in the monthly totals for September as they appear in the tables of the following pages, since the "observational month" ends with the observation on the last day of the calendar month. These amounts are, however, recorded as of October 1st and included in the totals for October. Exceptions to this practice include those stations at which precipitation is measured in the morning and recorded as of the preceding date. Thus, it is evident that for this month, the published rainfall totals for the "observational month" are, in many cases, much less than fell during the actual calendar month. The temperature during the first half of the month averaged near normal, with a rather sharp, brief cold spell and widespread heavy to killing frost in northern interior sections from the 12th through the 14th. After the 15th, there followed a period of above normal warmth which continued without break into the 30th, and resulted in a mean monthly temperature for the Section of more than 2° above normal.

NOV 1 3 1946
OF ILLINOIS

TEMPERATURE

The average monthly temperature for the Section, based on 118 records, was 62.6°, which is 2.3° above the mean for the past 59 years. The average temperature for the northern division was 60.2°; for the southern division, 64.1°. The highest monthly mean was 67.0° at Haverhill, Mass. and New London, Conn.; the lowest was 55.0° at Somerset, Vt. The highest recorded was 92° at Norwalk, Conn. on the 19th; the lowest was 24° at Randolph, N. H. and Woodstock, N. H. on the 13th. The greatest monthly range was 62° at Randolph, N. H. and Woodstock, N. H.; the least was 28° at Chatham, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 3.74 inches, which is 0.05 inch below the mean for the past 59 years. The average precipitation for the northern division was 3.76 inches; for the southern division, 3.72 inches. The greatest monthly amount reported was 7.54 inches at West Rutland, Mass.; the least was 0.66 inch at Presque Isle, Me. The greatest amount in 24 hours was 6.01 inches at Greenville, Me. on the 30-1st. The average number of days with .01 inch or more of precipitation was 6, which is 3 below the mean for the past 59 years.

The average snowfall for the northern division, based on 95 records, was a trace; for the southern division, based on 96 records, none; for the Section, based on 191 records, a trace, which is the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 134 records, was southwest. The average velocity, based on the records at 14 stations, was 7.2 miles per hour, which is 1.5 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 59 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 136 records, was 15 clear, 7 partly cloudy and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 85 percent, which is 4 percent above the mean.

Dates of Miscellaneous Phenomena

Auroras.— 16-20th, 23d, 26-29th.

Halos, lunar.— 7th, 13th.

Halos, Solar.—7th, 10th, 11th, 13th, 14th, 19th, 21st, 25th. 29th.

Hail. — Chatham, Mass. on 30th.

Sleet. – Norfolk, Conn. on 30th shortly before midnight.

Thunderstorms. — 2d, 8-11th, 18th, 23d, 24th, 26th, 29th, 30th.

Fog, dense.— 1-11th,13-30th.

Frosts. — (first killing, or first occurrence of minimum temperature 32° or lower)—In northern division, except coastal and southern Maine, southeastern New Hampshire and the Lake Champlain region of Vermont, on 4th, 12th or 13th depending upon suscepitibility of exposure; in the Berkshires of western Massachusetts and northwestern Connecticut on 14th. Not yet recorded elsewhere.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

¶ Amount of precipitation, occurring from time of observation on Sept. 30th until time of observation on Oct. 1., not included in monthly total for September, but considered in computing greatest amount in any 24 consecutive hours in September.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

Daily Precipitation for September 1946

Price: 5 cents a copy; 25 cents a year; (not stamps).
Remittance payable to Superintendent of Documents, Washington, D. C.

Vol. LVIII. Boston, Mass., October 1946. No. 10.

GENERAL SUMMARY

An early season occurrence of snow on October 1st and 2d in northern and western New England followed the passage of the cold front which had produced heavy rains over most of the Section on September 30–October 1, 1946. Only traces of snow were recorded at most stations where snow fell, with measurable amounts limited to extreme northern sections and the higher elevations. Remarkably heavy falls for so early in the season were recorded in the mountains of Vermont where depths up to 10 inches or more were recorded. After the passage of the storm, the unusually fine weather which had marked the month of September continued through October, and resulted in the most pleasant autumn weather of recent memory. Above normal daily temperatures predominated during the month, with but few brief periods of subnormal temperature. The average monthly temperature for the Section was one of the highest of record for October. The closing week was 10° to 15° or more warmer than normal, which contributed in large measure to the near record average monthly temperature; in some interior portions of Connecticut, the last four days of the month averaged more than 20° above normal. The month was considerably drier than normal in the southern division where total monthly precipitation averaged approximately a third of normal, and where the average number of days with measurable precipitation was 5 as compared with a normal of 9. In Boston, measurable precipitation occurred during only 4 of the daylight hours of the entire month, paralleling a record for the first 29 days of September noted in the preceding issue of this publication. Considerably below normal cloudiness, much sunshine and gentle winds complete the picture of a very pleasant October. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 117 records, was 52.9°, which is 3.4° above the mean for the past 59 years. The average temperature for the northern division was 50.4°; for the southern division, 55.5°. The highest monthly mean was 60.0° at New Bedford, Mass.; the lowest was 45.3° at First Connecticut Lake, N. H. The highest recorded was 90° at New Bedford, Mass. on the 6th; the lowest was 15° at Lemington, Vt. on the 21st. The greatest monthly range was 67° at Chelsea, Vt.; the least was 35° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 2.19 inches, which is 1.30 inches below the mean for the past 59 years. The average precipitation for the northern division was 3.23 inches; for the southern division, 1.17 inches. The greatest monthly amount reported was 6.70 inches at Moosehead, Me.; the least was 0.16 inch at Providence, R. I. The greatest amount in 24 hours was 4.64 inches at Moosehead, Me. on September 30–October 1. The average number of days with .01 inch or more of precipitation was 7, which is 2 below the mean for the past 59 years.

The average snowfall for the northern division, based on 90 records, was 0.4 inch; for the southern division, based on 95 records, a trace; for the Section, based on 185 records, 0.2 inch, which is the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 135 records, was southwest. The average velocity, based on the records at 14 stations, was 8.0 miles per hour, which is 2.0 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 65 percent of the possible amount, which is 11 percent above the mean.

Cloudiness was considerably below the mean. The average for the Section, based on 140 records, was 16 clear, 7 partly cloudy and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 81 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Dates of Miscellaneous Phenomena

Auroras — 3d, 8th, 9th, 19-21st, 24-28th, 31st.

Halos, lunar. — 2d, 3d, 7-10th, 15th, 30th.

Halos Solar. — 8th, 9th, 16th, 17th, 20th.

Hail. — None.

Thunderstorms. — 1st, Ft. Fairfield, Me.; 18th, Sandwich, Mass., Providence, R. I., and Connecticut coast; 26th, northeastern Massachusetts, parts of Berkshires and northwestern Connecticut.

Fog, dense. — 3-16th, 18-31st.

Frosts. — (first killing, or first occurrence of minimum temperature 32° or lower) — On 9th or 20th in Champlain Valley of Vermont; on 3d, 9th, 14th, 20th and 22d, progressively depending upon susceptibility, in coastal and southwestern Maine, southeastern New Hampshire, and southern division except coastal and sheltered areas. (First killing frost recorded in September elsewhere in northern division and in Berkshires and northwestern Connecticut.)

Sleet. — 1st, widely scattered over northern division and Massachusetts, and at Norfolk, Conn.; 2d, widely scattered over northern portion of northern division and at Norfolk, Conn.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning

[b] Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

¶ Amount of precipitation measured on October 1st was not available in time to be considered in September's compution of "greatest (precip.) in 24 hours".

recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Termometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular. [6] Amount of precipitation measured on October 1st was used in September's computation of "greatest (precip.) in 24 hours" but is included only in October's total precipitation (not in September's total).

Daily Precipitation for October 1946

VOL. LVIII. BOSTON, MASS., NOVEMBER 1946. No. 11.

GENERAL SUMMARY

November, 1946, in New England marked the third consecutive month of above normal temperature and subnormal precipitation. The fine, mild weather which had prevailed for the two preceding months continued through November. It would be difficult, if not impossible, to locate in New England weather records another fall of comparable excellence. In Boston, the first killing frost of the season occurred on the 16th, which is about three weeks later than the average date. Although average cloudiness, sunshine, and number of days with measurable precipitation did not vary greatly from normal, most of the precipitation was light and occurred during the night-time, so that nearly all of the daylight hours were free of measurable precipitation. Snowfall was notably deficient, particularly in the northern division where the average total fall, 1.4 inches, was more than 5 inches below normal. In the southern division, average snowfall was a trace, compared with a normal of 2.6 inches. With but few brief breaks, daily temperatures were persistently above normal, and maxima on the 4th, 26th, and 27th approached record highs for the dates. Precipitation was unequally distributed, the northern division receiving approximately 81 percent of normal, while the southern division recorded but 33 percent of normal. There was a notable absence of severe storms of which one or more are usually experienced during this month. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 116 records, was 41.5°, which is 3.4° above the mean for the past 59 years. The average temperature for the northern division was 37.9°; for the southern division, 45.2°. The highest monthly mean was 50.4° at New Bedford, Mass.; the lowest was 29.8° at Caribou, Me. The highest recorded was 79° at Chestnut Hill, Mass. on the 1st; the lowest was —3° at Houlton, Me. on the 30th. The greatest monthly range was 63° at Falls Village, Conn.; the least was 30° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 1.95 inches, which is 1.58 inches below the mean for the past 59 years. The average precipitation for the northern division was 2.73 inches; for the southern division, 1.19 inches. The greatest monthly amount reported was 5.08 inches at Lemington Vt.; the least was 0.63 inch at Holyoke, Mass. The greatest amount in 24 hours was 1.51 inches at Rockland, Me. on the 11-12th, and Lincoln, N. H. on the 2-3d. The average number of days with .01 inch or more of precipitation was 9, which is 1 below the mean for the past 59 years.

The average snowfall for the northern division, based on 90 records, was 1.4 inches; for the southern division, based on 88 records, a trace; for the Section, based on 178 records, 0.7 inch, which is 4.1 inches below the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 135 records, was northwest. The average velocity, based on the records at 14 stations, was 9.8 miles per hour, which is 1.0 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 47 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 143 records, was 9 clear, 7 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 76 percent, which is the mean.
